

What Is the Best Adaptive Radiotherapy Modality?

Everyone agrees that adaptive radiotherapy is transforming cancer care. But which technology will ultimately define its future?

- **Is it CT/CBCT-Linac**, leveraging widespread availability, rapid workflows, electron-density accuracy, and seamless integration into existing clinical practice?
- **Is it MR-Linac**, offering unparalleled soft-tissue visualization, real-time motion management, and the potential for functional imaging-guided adaptation?
- **Is it PET-Linac**, enabling biologically informed treatment based on tumor metabolism, hypoxia, proliferation, and other molecular characteristics?
- **Is it proton and particle therapy**, where adaptation may provide the greatest clinical benefit by mitigating range uncertainties and ensuring that delivered dose truly matches the intended plan?

Come to this lively debate where everyone participates. Pick a side. Challenge assumptions. Help determine which approach offers the greatest promise for patients. Defend competing visions for the future of adaptive radiotherapy. Each team will make its case. Each team will challenge the others. Only one can claim the title of *Best Adaptive Modality*.

Come for the debate. Stay for the controversy. Leave with a new perspective.
